

AAYUSHI RAJESH

Frontend Developer

aayushirajesh7@gmail.com • Pathanamthitta, Kerala

[LinkedIn](#) • [GitHub](#) • [Figma](#)

PROFESSIONAL SUMMARY

Final-year B.Tech CSE student (graduating 2027) specialising in frontend development with a strong focus on UI/UX design quality, component architecture, and user experience. Proficient in React.js, Tailwind CSS, Framer Motion, and Supabase, with hands-on experience shipping cross-platform desktop applications using Electron.js. Designs in Figma before writing a single line of code. Looking to contribute to a team where thoughtful UI work and clean frontend engineering are valued.

EDUCATION

B.Tech in Computer Science & Engineering (Minor: Robotics)

2023 – 2027

Mangalam College of Engineering, Ettumanoor

CGPA: 8.02 / 10

SKILLS

Frontend: React.js, JavaScript (ES6+), HTML5, CSS3, Tailwind CSS, Framer Motion

Backend & APIs: Node.js, Express.js, Supabase (Auth, RLS, Postgres), REST APIs, Groq LLM API, Notion API

Desktop: Electron.js

UI/UX & Design: Figma, Adobe Photoshop, Canva

Languages: JavaScript, C, Python

Tools & Platforms: Git, GitHub, Linux, VS Code

PROJECTS

[Memory Palace](#) (In Progress) | [React.js](#) • [Tailwind CSS](#) • [Framer Motion](#) • [Supabase](#)

- Building a full-stack web app where users write memories as letters stored behind animated floating doors in a celestial palace environment
- Implemented complete user authentication and session management using Supabase, including protected routes and Row-Level Security policies for private user data
- Designed the full UI/UX in Figma prior to development, translating a detailed celestial aesthetic into production-ready React components
- Integrating Framer Motion for entrance transitions and floating door animations to create an immersive, distinct user experience

[LifePilot — AI Task Planner](#) | [Node.js](#) • [Express.js](#) • [Groq LLM API](#) • [Notion API](#) • [HTML](#) • [CSS](#) • [JavaScript](#)

- Built an AI-powered productivity tool that converts a user's goal into a structured, multi-day task plan with auto-assigned categories, priorities, and dates using the Groq LLM API
- Integrated the Notion API to sync generated task plans directly to a user's Notion database, enabling real-world utility beyond the app itself
- Implemented an editable task preview step before saving, giving users control over AI-generated output — a deliberate product design decision
- Architected a Node.js + Express backend to handle LLM requests, plan formatting, and Notion sync in a clean server-side pipeline

[Pomodoro With Miu — Cross-Platform Desktop App](#) | *Electron.js • HTML • CSS • JavaScript*

- Built and shipped a cross-platform desktop productivity app with clearly separated work and break sessions, distributed as a packaged Windows installer
- Applied deliberate UI constraints to minimise distraction and encourage consistent focus; designed the complete interface in Figma before implementation
- Managed the full release cycle including versioning, packaging, and distribution using Electron's build tooling

[To-Do List — Desktop Task Management App](#) | *React.js • Electron.js • CSS*

- Built a component-based desktop task management app combining React state management with Electron's cross-platform desktop runtime
- Structured reusable components and predictable state updates to keep the app maintainable as features scaled
- Designed the interface in Figma prior to development, emphasising a clean and minimal layout

[Web Weather — Real-Time Weather Web App](#) | *HTML • CSS • JavaScript • OpenWeatherMap API*

- Built a responsive weather web app using vanilla JavaScript to fetch and display live data from the OpenWeatherMap API
- Integrated the browser Geolocation API for automatic location detection, reducing manual input friction
- Implemented a dynamic day/night mode that updates interface styles based on real-time conditions
